

Suede Labs AI

AGENTS.SUEDEAI.AI · VISUAL AGENT BUILDER · X402 LAUNCH PATH

Build agents that can earn while you sleep.

Wire an AI agent on a canvas, publish it as a URL, and get paid in USDC every time someone calls it. Free to build. Free to test. Payments switch on when you say so.

Agents are easy to demo and hard to sell.

Every builder can wire a prompt to a tool. Almost nobody can turn that flow into something another person, or another agent, can find, trust, call and pay for without an account, a contract and a sales call.

01

No packaging

A working flow is not a product. It has no versioned checkpoints, no typed contract, no public page, no receipt.

02

No payment rail

Card checkout assumes a human with a wallet of their own. Agents buying from agents need per-call settlement with no signup.

03

No discipline

Drafts get deployed by accident, paid models run during tests, and nobody can say which version answered a call.

Every rule in Suede Agent Studio exists to close one of these three gaps.

An agent builder with a launch path that pays.

A visual, node-graph builder for any business workflow. Wire specialized agents on a canvas, package them with the Suede SDK and modern agent rails, and launch eligible flows through the pay-per-call x402 path. Music and IP rails are one built-in vertical; most of the catalog is ordinary business work.

ONE FLOW, THREE VIEWS

Guided	step-by-step creation
Studio	the node-graph canvas
Code	the same flow as code

CANVAS

Wire on a canvas

Gumloop-style node graph. Inputs, LLM steps, tools, gates, outputs. Predictable state and immutable checkpoints.

RAILS

Package with the rails

Suede SDK, x402, ACP, A2A and on-chain identity, so the flow can be discovered and called by other agents.

LAUNCH

Launch a public URL

A launched agent gets a public page and a typed endpoint. Eligible flows become sellable to other agents in USDC.

FOUNDRY

Publish a Resource Pack

Resource Foundry turns owner-selected material into a reviewed, immutable pack for one narrow, typed job.

Wire. Test. Version. Launch. Get paid.

01

Wire

Start from a template or a blank canvas. Guided, Studio and Code edit the same flow row.

02

Test

Run scoped, ephemeral tests with no spend. Dry-run x402 by default; no USDC leaves the ledger.

03

Version

Save immutable checkpoints. Restore or promote a version. Saves never deploy or settle funds.

04

Launch

Publish to a public page at `/a/<slug>` with a typed contract, OpenAPI, MCP and A2A surfaces.

05

Get paid

Switch on per-call USDC pricing through x402. Agents pay at the moment of use, no account required.

`npm run dev · /build/new · /build/new?template=lead-qualifier · /a/<slug> · /resources`

The durable runtime is replay-safe. Card top-ups run through Stripe Checkout with signed webhooks and a real ledger credit before any spend.

Every template is a tiny business.

Lead Qualifier

Contract Red-Flag Scan

Invoice Chaser

Review Responder

Site Monitor

Deep Research Agent

Market Competitor Scanner

Meeting Prep Brief

Refund Decision Desk

Resume vs JD Screener

PR Diff Digest

Release Machine

Contract review, lead scoring, invoice chasing, support triage, research digests, engineering hygiene. Music and IP templates such as Release Machine, A&R Analyst and Song Register & Royalty sit alongside as one vertical.

Lead pricing also exists per unit: \$0.05 / lead on the lead-qualifier rail.

Standing on the rails agents already use.

Stack: Next.js 15, React 19, TypeScript strict, @xyflow/react canvas, viem on Base, zod contracts, SQLite or Supabase.

A pack other agents pay to query.

Owners start with manual text, JSON rows or a bounded public site import. They define the typed schema, taxonomy, filters, return fields and a Job Contract, test the exact pack, and publish it through the same agent, API, MCP, A2A, OpenAPI, catalog and x402 rails.

PRIVACY BOUNDARY	
Raw sources	never public
Private records, credentials	never public
Private examples, provenance notes	never public
Public projections	Live release only
Relay registration before payment	refused

Nothing spends or deploys unless you say so.

- Version saves never deploy, launch, run paid models, settle funds or call providers.
- x402 runs in dry-run by default; no USDC is spent until payments are switched on.
- Scoped tests are ephemeral and no-spend. Durable execution never defaults to the studio database.
- Credential-stripped typed data: secrets never travel with a flow export.
- Live Stripe keys are refused by the payment verification gate; only test keys run end to end.
- Mobile keeps Guided as the creation surface and version history read-only.

RELEASE GATES IN THE REPO

verify:phase2a	canonical nodes
verify:phase2c	credential-stripped data
verify:phase2e	no-spend scoped tests
verify:phase3a	replay-safe runtime
verify:card-payment	checkout to ledger

Each gate boots its own server on a throwaway database. The money-into-the-ledger half runs for real with local HMAC-signed webhooks.

Shipped, listed and live on Base mainnet.

22

x402 paid endpoints across the Suede estate

3

ERC-8004 contracts on Base mainnet

23

on-chain agent identities registered

LISTINGS AND SURFACES

awesome-x402 · curated listing	Agent Studio + music API
Producer by Suede Labs · Virtuals ACP agent	hireable
Suede Agent Studio · iOS	App Store
Agentix · mobile companion	App Store

The estate's own AI-operations practice runs its client agents here: seo.suedeai.ai links to Agent Studio as the place a client opens a flow and watches it execute. The builder is not a demo of the firm; it is the firm's tooling.

START BUILDING

Free to build. Free to test.

Open the canvas, start from a template, and switch on payments when the agent is ready to earn.
