

Suede Labs AI

IP.SUEDEAI.AI · PUBLIC PROVENANCE REGISTRY · BASE + AVALANCHE

Your music, on the record.

Fingerprint a file, sign a creator claim, add your contributors, and file a public timestamp on Base and Avalanche mainnet. Two minutes. About a cent in gas. A receipt built to last.

Creation got cheap. Ownership didn't scale.

AI drove the cost of making songs, images and video toward zero. Copyright protects ownership after distribution; AI-era media moves faster than that. When a track is trained on, remixed or claimed by someone else, a creator's word is all they have.

\$0.01

about a cent in gas to file a public record

2 min

from upload to a claim anyone can verify

THE QUESTIONS A FILE CANNOT ANSWER TODAY

Who made this? unprovable

When? no dated record

Who gets paid? no contributor record

May a model train on it? no consent on file

Ownership has to be machine-readable, upstream, and portable across humans and agents.

Four facts, signed, timestamped, public.

CLAIM

Wallet-signed creator claim

The creator signs the claim from their own wallet. No custodian speaks for them.

FINGERPRINT

Exact-file fingerprint

A cryptographic hash of the exact file. Change one sample and the fingerprint changes.

CONTRIBUTORS

Contributor record

Co-writers, producers and performers on the record with their splits, before the money exists.

TIMESTAMP

Public timestamp

Filed on Base and Avalanche mainnet. Dated evidence anyone can check without asking Suede.

Consent terms travel with the record: a registered work can state whether AI training is permitted, so an authorized use pays and an unauthorized one meets a public record instead of a creator's word.

Two minutes, then the claim is public.

EXAMPLE SESSION

```
suede register acapella-take3.wav --facet voice --consent no-training
```

```
OK · sealed sd_2b4f · consent terms attached
```

A public record. Not a copyright office.

IT IS

- Public, dated evidence of authorship and contribution
- Machine-readable: agents and platforms can verify it
- Chain-native on Base and Avalanche, verifiable by anyone
- A record of consent terms for AI training
- About a cent to file, and yours to keep

IT IS NOT

- A copyright registration with a government office
- Custody of your files; only the fingerprint is on record
- A label deal, a distributor or a publishing administrator
- A requirement to understand crypto or hold tokens
- A promise about what a court will decide

Read: ip.suedeai.ai/docs/what-is-the-registry

Voice, face, name and the work, on the record.

A generative model can reproduce a face from a press kit and a voice from one verse. That makes identity a commercial surface. Suede treats the whole likeness as catalog: the reference works an identity travels through enter the registry with dated proof and machine-readable consent terms.

Voice

a cappellas, demo vocals,
isolated stems

Face

press photos, album art,
portrait sets

Name and persona

stage names, aliases, the
performed character

The work itself

tracks, stems, artwork, video

IDENTITY REGISTRY · EXAMPLE SESSION	
register presskit/ --facet face -- license commercial	12 works sealed
register acapella-take3.wav --facet voice	consent: no-training
verify suspect-clip.mp4	NO CONSENT ON RECORD
dated evidence	sd_2b4f + 12 works

An authorized use pays. An unauthorized one meets a public record.

The rights stack underneath the registry.

17

public works on record: 14 on Base,
3 on Avalanche

30

indexed pages: docs, articles and
record pages

2

mainnets, one record format

IP registry contract

Licensing templates

Derivatives

Royalty distribution

Base smart contracts for an IP registry, licensing templates, derivatives and royalty distribution. Every contract and transaction is public and verifiable on mainnet.

RECORD

USPTO provisional application 63/947,120

Contracts github.com/Suede-AI

Settlement asset USDC on Base

Four stages. One spine. This is the wedge.

Suede's wedge

Everything downstream settles against the proof layer. A licence, a royalty split or an agent's per-call payment all point back at a record that says who made the work and on what terms.

Anyone whose work can be trained on, remixed or monetized without them.

- Independent artists and producers with a catalog and no paper trail
- Co-writers who want the split on record before the money exists
- Vocalists and performers whose voice and face are now reproducible
- Platforms and agents that need machine-readable rights before they use a file

Do I need to understand crypto? No. Is this a copyright registration? No. Both answers are on the homepage FAQ, in plain language.
